Executive Summary

Customer Engagement & Product Utilization Analytics for Retention Strategy

Business Challenge

Customer churn affects customer relationships and portfolio performance. This project identifies groups with different observed churn patterns to support retention planning.

Dataset Snapshot

The analysis includes 10,000 customer records with demographic, geographic, tenure, financial, product, activity and exit-status fields.

Measure	Result
Total customers	10,000
Exited customers	2,037
Retained customers	7,963
Overall churn	20.37%
Overall retention	79.63%
Active-member churn	14.27%
Inactive-member churn	26.85%
Average products per customer	1.53
Inactive share of high-balance group	49.88%

Key Findings

Inactive-member churn is 26.85%, compared with 14.27% for active members.

Product-count groups show different observed churn rates.

The high-balance segment contains 2,500 customers, including 1,247 inactive customers.

Cardholder retention is 79.82%; non-cardholder retention is 79.19%.

Recommended Actions

Prioritize engagement and relationship reviews for inactive customers.

Investigate high-churn product-count groups before intervention.

Review inactive high-balance customers through a service-led process.

Apply customer-needs and suitability checks before cross-selling.

Track retention KPIs consistently and evaluate future outcomes.

Important Cautions

The analysis is observational and identifies associations, not causes. Activity and product count are proxies. The high-balance group is not a verified premium-customer classification.

Conclusion

The project provides a measurable baseline for retention planning. Future evaluation should determine whether targeted engagement actions improve retention.
